

A deep-field astronomical image showing a vast number of galaxies in various colors (blue, orange, white) against a black background. The galaxies are of different shapes and sizes, some appearing as bright, distinct objects while others are fainter. A large, solid black circle is centered in the image, containing the word "Problems" in white text.

Continuous

Discrete

A deep-field astronomical image showing a vast field of galaxies and stars against a black background. The galaxies are in various stages of evolution, with some appearing as bright, diffuse clouds and others as more compact, structured systems. The colors range from warm oranges and yellows to cool blues and purples, indicating different temperatures and chemical compositions. Two thin, horizontal blue lines are positioned above and below the central text.

DISCRETE SYSTEMS

A deep-field astronomical image showing a vast field of galaxies in various colors (blue, orange, white) against a black background. The galaxies are of different shapes and sizes, some appearing as bright, fuzzy blobs and others as more distinct, elongated structures. A thin blue horizontal line is positioned above the word 'POLL'.

"The world's first photograph—or at least the oldest surviving photo—was taken by Joseph Nicéphore Niépce in 1826 or 1827. Captured using a technique known as heliography, the shot was taken from an upstairs window at Niépce's estate in Burgundy. As heliography produces one-of-a-kind images, there are no duplicates of the piece, which is now part of the permanent collection at the University of Texas-Austin." [18 Famous First Photographs in History: From the Oldest Photo Ever to the World's First Instagram](#)

"We may be used to selfies now, but it's Robert Cornelius's 1839 image that lays claim to the first self-portrait. Taken in Philadelphia, Cornelius sat for a little over one minute before covering the lens." [18 Famous First Photographs in History: From the Oldest Photo Ever to the World's First Instagram](#)

A cosmic background image featuring a dense field of galaxies in various colors (yellow, orange, blue, red) against a black space. Two horizontal blue lines are positioned above and below the central text.

UNARY SYSTEM

aka. Base-1

how many positions to represent the moon's distance to the sun if an **Oracle** said it is ~150 million km and earth's diameter is ~13,000 km?

$\sim 150 \text{ million km} \div \sim 13,000 \text{ km} = \sim 12,000 \text{ Earth}$
paper = $\sim 3,000 \text{ positions}$
 $12,000 \div 3,000 = 4 \text{ pages!}$

A deep-field astronomical image showing a vast field of galaxies and stars against a black background. The galaxies are in various stages of evolution, with some appearing as bright, diffuse clouds and others as more compact, distant objects. The colors range from warm oranges and yellows to cool blues and purples, indicating different temperatures and compositions. Two thin, horizontal blue lines are positioned above and below the central text.

$\sim 7 \text{ positions}$

$$N = 12,000 \rightarrow (2323200)_4$$

We'll see how to convert from decimal to base-4 or any other number systems later. Stay tuned!

A photograph of a desert landscape at dusk or dawn. The sky is a soft, uniform pinkish-orange. In the foreground, there are two large, reddish-brown rock formations. The one on the left is a tall, rectangular butte with a smaller, thinner spire rising from its right side. The one on the right is a shorter, wider butte with a large, dark, rectangular opening or cave entrance. The ground is dark and rocky, with some sparse, low-lying vegetation.
